

Stealth-Mode Internal AI Vault

Installation Guide (5 Steps)

1) Environment Lock

Deploy the Vault node on an internal workstation/server. Restrict outbound internet access and keep the system on your private network only.

2) Document Ingest

Upload contracts, SOPs, intake docs, and case files to the local knowledge directory. Run the index command once to build memory.

3) Access Controls + Redaction

Configure staff roles and enable redaction policies for PII, financial IDs, and sensitive legal/medical fields.

4) Validation Test

Run a 20-question internal QA set to validate response speed, answer quality, and policy redaction behavior.

5) Go Live

Enable production mode, connect internal users/endpoints, and monitor logs daily for the first week.
